## I. INTRODUCTION

"Sports Participation 2013 Edition: Snow Sports" is a research program designed to measure the number of individuals seven years of age or older who participated in a number of different sports/recreational activities within the previous year.

This study measures the annual number of participants in each sport, the frequency of participation (number of days of participation in 2012), total days of participation, the mean (average), and median (mid-point) number of days of participation.

Individual Sports Tables are generated for selected demographics, including gender, age, mean age by gender and frequency of participation, education of male and female household heads, household income, market size, U.S. census region, and ethnicity/race.

The data reported for ethnicity/race should only be used to rank sports participation within that ethnic/racial group. Due to sampling constraints, it is inappropriate to subtract this data from the total in order to arrive at participation numbers for non-African American or non-Hispanic participants.

## **II. METHODOLOGY**

### **A. Sampling**

For the study, an online panel of more than 38,000 households maintained by TNS was used. The panel is balanced on a number of characteristics determined to be key indicators of general purchase behavior, including household size and composition, household income, age of household head, region and market size. Please note race and ethnicity are not the key indicators of general purchase behavior, and thus African Americans and Hispanics are somewhat underrepresented in the sample.

2010 marks the first year that an online survey methodology was used for collecting data on sports participation. Prior to 2010, this annual study was conducted using a mailback survey methodology. Readers should keep this in mind when making direct comparisons to data published prior to 2010.

### **B. Questionnaire**

In February 2013, sample members of the TNS panel were invited to complete the sports participation survey online. Respondents were asked to indicate the age and gender of all household members age seven and older, and provide the number of days of participation for each sport in 2012. Fifty-six sports were listed, including those shown in this report's table of contents.

In order to reduce a bias effect that is possible from the order in which the sports were listed, the list was shown in alphabetic order to half of the households, and in reverse-alphabetic order to the remaining half of households.

### **C. Returns**

The study results are based on over 29,000 individuals in these households who are age 7 and older. In order to ensure returns were representative of the U.S., the data was weighted to represent the demographic composition of the U.S. based on the following characteristics: state of residence, household income, and population density.

The returns were then projected to 285,533,000 - the U.S. population age 7 and older in 2012. An 18-cell age/gender weight matrix was used to project the weighted sample to represent the actual age and gender distribution of the U.S. population.

### III. STATISTICAL NOTES

It is important to note that in basing estimates of a population on a sample drawn from that population, a degree of sampling error is possible. While a number of biases can affect the extent of sampling error, it is to a great degree dependent on the size of the sample. The larger the sample, the more closely the estimate represents the total population.

Sampling error also affects samples of the same size. A sample drawn from a population will result in an estimate for a characteristic of the population, the proportion of archers for example. If another sample were drawn, it would be likely to include different members of the population. This would yield a slightly different estimate of the proportion of archers.

To allow judgments and decisions to be made with confidence when using samples, we can determine a confidence interval for the estimate.

A confidence interval is simply a range. A 95% confidence interval for the proportion of archers in the population is a range in which the estimates for the proportion of archers would fall 95% of the time, were the study to be done repeatedly. For example, in a particular year, the proportion of respondents who stated they participated in archery may be 2.3% (after weighting and projection). Thus, if we were to estimate the proportion of archers in the United States using 100 similar studies, 95 of those studies would yield an estimate within 95% confidence interval of 2.2%-2.4% (+/-0.1%) from the stated proportion.

The confidence interval for measurement of the proportion of participants in each sport does not exceed +/-1.0%.

## IV. DATA INDICATED IN THE REPORTS

### A. Participants

A participant is defined as an individual seven years of age or older who participates in a sport more than once a year. The definition of "Frequent", "Occasional" and "Infrequent" participants varies for each sport and is indicated in the report.

Note that this study also reports separately the number of individuals who participated "1 Day Only in 2012" for each sport. These are not included in "Total Respondents in 2012" for each sport since they are not "participants" as defined above.

"Snowboarding (Net)" is the net of "Snowboarding (At Resort)" and "Snowboarding (Not at Resort)".

### B. Means

Following the frequency distribution, the total participant days and the mean (average) number of participant days is reported for each sport.

### C. Geographic Regions

The tables in this report show the demographic distribution of participants for each sport by geographic region. The states in the geographic regions are:

<u>New England</u>	<u>Middle Atlantic</u>	<u>East North Central</u>	<u>West North Central</u>	<u>South Atlantic</u>	<u>East South Central</u>	<u>West South Central</u>	<u>Mountain</u>	<u>Pacific</u>
CT	NJ	IL	IA	DE	AL	AR	AZ	CA
ME	NY	IN	KS	FL	KY	LA	CO	OR
MA	PA	MI	MN	GA	MS	OK	ID	WA
NH		OH	MO	MD	TN	TX	MT	AK
RI		WI	NE	NC			NV	HI
VT			ND	SC			NM	
			SD	VA			UT	
				WV			WY	
				DC				

These regions are the same as those used by the U.S. Bureau of the Census, and include Alaska and Hawaii.

# ***Participation Overview Snapshots***

# Participation Overview Snapshots

## Participation Definitions

Participant: an individual 7 years of age or older who participated more than once during 2012.

Frequent, Occasional, and Infrequent participation are defined within the frequency pie chart on the following pages.

As an example, “Frequent (50+)” means a person must have participated at least 50 times during the year to be considered a frequent participant.

## Explanation / Example of an Index

An index removes bias towards participation in larger segments of the population by focusing on concentration of participation within a given segment. It determines if participation within that segment is under or over-developed as compared to the other segments being examined.

### How to Read:

Most data sets have three rows:

- Row 1: total participation for that segment (i.e. 2.4 million participants are males between 12-17 yrs. old)
- Row 2: read vertically (i.e. 26.5% of male participants are frequent participants, 53.9% are occasionals, and 19.6% are infrequent)
- Row 3: read horizontally (i.e. 30.4% of the 2.9 million frequent participants are males between 7-11 yrs. old;  $30.4\% / 88.5\% = 34.4\%$  of frequent male participants are between 7-11 yrs. old)

### How to Read:

Most data sets have three rows:

- Row 1: total participation for that segment (i.e. California had 1,964,000 participants)
- Row 2: read vertically (i.e. 34.5% of participants in California were frequent participants)
- Row 3: read horizontally (i.e. 13.9% of all frequent participants in the U.S. were located in California)
